DANS AND GUYS AMAZING TRANSPORT SYSTEM!

Rules of use:

1) To work you must have a Document. Create a new document using the "1" function. The command will return your document ID, which will be used in many functions.

2) Every time you wish to alter the document you need to use your document ID.

3) In the main menu there are many functions, in 4 main categories.
 a) Display function – return list of all the available 'X' (stores, products, etc…)
 b) Add function – add items to your document
 c) Edit function – after you have finished your Transport Document you may change anything you wish. The change will be recorded and stored.
 d) Print function – prints out the document you have.

4) C and D functions have their own menu, for easier readability.

5) We followed our scenario from Part 1. In this scenario there is an order to adding items, according to the list below:
 a) Add store
 b) Add product
 c) Add supplier
 d) Add truck
 e) Add driver
 f) Additional items may be added as you please
 Not following this order may results in errors!!!

6) Each function will ask you to enter different variables based on its needs. You may need to use the display function in order to know which details to enter.

7) **Each variable needs to be entered in a separate line, therefore after each entry press return!!!**

8) Information that has been entered:
 a) We have added a document with an id: '0'. The fields in this document have been initialized.
 b) When run the project loads several Stores, Products, Suppliers, Drivers and Trucks for your use.

Hope you enjoy,
 Dan and Guy
